**Department of Health and Hospitals Update
9/4/08 Update on Water Systems under Boil Advisory**

BATON ROUGE -- Hurricane Gustav has caused widespread power outages and damage to drinking water systems throughout Louisiana.

- [Click here](#) for a list of water systems that are under boil advisory until released by the Department of Health and Hospitals.
- [Click here](#) for a list of drinking water systems that have water that is safe to drink.

If you live in an area under boil advisory or you have lost water pressure at your tap or if the water pressure is extremely low State Health Officer Jimmy Guidry, MD, recommends that homeowners disinfect their water by any one of the following methods prior to consumption (including drinking, cooking, brushing teeth or preparing food):

- Boil water for one full minute in a clean container. The one minute boil time begins after the water has been brought to a rolling boil. (The flat taste can be eliminated by shaking the water in a bottle or pouring it from one container to another.)
- If the water is clear, mix 1/8 teaspoon of unscented, liquid chlorine laundry bleach with one gallon of water and let it stand for at least 30 minutes prior to consumption. If the water is cloudy or colored, use 1/4 teaspoon per gallon of water. Be sure to mix thoroughly. If the treated water has too strong a chlorine taste, it can be made more palatable by allowing the water to stand exposed to the air for a few hours or by pouring it from one clean container to another several times.

Boiling is the most effective method of disinfection of water, particularly for people who are severely immunocompromised (infected with HIV/AIDS, cancer and transplant patients taking immunosuppressive drugs, or people born with a weakened immune system) and for infants and elderly who wish to take extra precautions.

People obtaining water from a public water system (a system providing water to 15 homes and businesses or more) must continue to disinfect their drinking water by one of the above listed methods until a public notice is issued by the Department of Health and Hospitals that the water has been tested and is safe to drink. It may take as long as two or three weeks before a water system is declared safe.

People who have been affected by loss of water service may expect some irregularities with their water while efforts are being made to ensure that the water is safe. It is expected that water may have an unusual chlorine odor as well as possible sediments appearing in the water while these special precautions are taking place. Flushing household taps for a few minutes should fix this problem.
